

## Channel Nuts

PEAKSIGHT provides an extensive selection of quality machined **Channel Nuts** and **Stud Nuts** which allow attachment of fittings to the channel face. The full line of fittings brackets and specialty components as well as associative materials and components are easily bolted (or machine screw fitted) to the open face of any channel section with a vise like clamping action which delivers tremendous pull out and slip resistance. The nuts are generally positioned with an appropriate size or style spring (although **springless** styles are preferred by many). Aligned parallel with the open slot, the nut (A) is simply pushed into the channel and turned perpendicular, it automatically pushes back against the in turned lips of the channel with a positive locking action (B). The fitting is then aligned and easily positioned by merely moving the nut along, (C). Tighten to complete the operation.
